My Open Manifesto by Ray Dela Rama [raymond.delarama55@gmail.com] 10/15/26

PART I: INTRODUCTION & CORE THESIS

I am writing this for myself first, driven by a vision of the future I'm committed to making real. Bringing this vision to life requires fast progress, yet the work will never move faster than the foundation can carry, so that the foundation is strengthened before each new weight arrives.

Vision: A world where everyone is safe, free, and treated fairly, and able to grow, belong, and contribute.

How we build it: We design systems, norms, and incentives so that the easiest, most rewarding, and highest-status paths are those that create real value for others, through better tools, knowledge, experiences, relationships, and understanding. Society advances through high-quality products and services built strictly on moral good (like honesty, consent, fairness, kindness, and respect). Moral evil (like deception, exploitation, coercion, theft, and violence) becomes reliably unprofitable, low-status, and rare.

What this is not: This is not a call for perfect people or a frictionless utopia. It is a design that makes constructive behavior the path of least resistance and destructive behavior costly and unattractive. A person's worth never depends on what they can produce.

Thesis: By removing the massive hidden costs of deception, exploitation, and other moral-evil defaults through clear local trade unions with open clearing and mutual credit tools, a moral-good trade network creates demonstrably better economic life for participating communities. Because it replaces debt interest, payment bottlenecks, defensive overhead, and fraudulent waste with clearing, ledger transparency, and high-quality products and services that actually improve lives for the long term, it operates with overwhelming economic efficiency — naturally outcompeting extractive systems through sheer operational superiority, without forcing anyone to participate.

This thesis is tested and proven through empirical validation at each step:

1. **At the local scale**, by proving that closed-cycle obligation netting clears frozen B2B trade credit without bank debt, directly lowering working-capital costs for participating businesses.
2. **At the network scale**, by proving that radical ledger transparency and portable reputation make fraud and corruption structurally unprofitable inside the union compared to the legacy economy.
3. **At the macro scale**, by demonstrating that securing roughly 50% of core commercial trade volume across high-density trade corridors creates an autonomous, zero-friction economic engine — pulling productive market participants in voluntarily through sheer operational superiority, regardless of how entrenched legacy incumbents are in unfair practices.

Here is what the thesis looks like in plain everyday life:

- **No Endless Waiting to Get Paid:** Unpaid invoices cancel out automatically in closed cycles, giving businesses rapid relief room without taking on expensive bank debt.
- **Cheaper to Run a Business:** Without high bank interest, heavy legal fees, or middleman cuts, the cost of doing business drops significantly.

- **Higher-Quality Products and Services:** Because members are held to a clear moral standard, products are built to serve human needs that improve lives for the long term.
- **Protection in Hard Times:** If the broader economy freezes or experiences a cash shortage, local businesses can keep trading essential goods and services safely with each other.
- **Complete Peace of Mind:** Full ledger visibility means you always know who you are dealing with, eliminating the fear of hidden debts or scams.
- **Stronger Local Communities:** Value stays within the network and the local area, helping participating businesses grow, create work worth working, and ultimately, life worth living.

When these local benefits scale across supply chains, the network reaches its macroeconomic tipping point: **securing roughly 50% of core commercial trade volume** — meaning the total gross B2B transaction volume of supply-chain invoices paid between companies, which is usually 2.0x to 2.5x larger than a country's GDP.

Even under the worst-case assumption where all existing volume-holding incumbents choose to remain trapped in deceptive or predatory practices, the network does not rely on their conversion. By federating producers, suppliers, and distributors who do only moral good into independent, zero-interest mutual credit clearing cycles, the network constructs an autonomous parallel economy — building alternative supply-chain corridors that route around legacy bottlenecks. At this threshold, the massive savings in working capital and zero-interest settlement make the network the dominant economic attractor, pulling the rest of the market in voluntarily simply because it works better.

At a foundational level, moral evil — like fraud, coercion, delayed payments, and deception — acts as heavy friction on human output. It forces society to waste massive time, energy, and capital on defensive overhead like lawsuits, bank interest, middleman audits, and risk premiums just to protect against betrayal. When trade is anchored strictly in moral good, that systemic friction shrinks sharply. Human effort converts far more efficiently into real productivity. **Higher productivity expands real economic output, allowing society to solve hard problems, advance technology, raise standards of living, and move civilization forward faster, safer, and with far less wasted human suffering.**

To turn this into reality, I'll be completely honest: I have no achievements online that prove I am fit to work on making this vision a reality. But a key framework I apply to all my work is to observe what people far ahead of me are doing, take what's useful, discard the rest, and add something of my own.

I'm determined to make this work, alongside trusted individuals who share the vision and have the skills and motivation to work on it. I am sharing my plans openly to attract capable leaders with an extraordinary sense of responsibility, strong ambition, relentless curiosity, and a genuine concern for where this work leads. I'm not looking for anyone to manage: I expect every leader to manage themselves and lead through their own work.

For myself, I don't value money, fame, status, power, or other social markers for their own sake. I value them only as tools, for making this vision real and for the people I care about and work with, if they want them. Tools can be used for moral good or moral evil, and I will use them only for moral good.

More broadly, I'll do everything I need, using only morally good means, to make this vision real and prevent total failure, but never at the cost of who I want to be or the boundaries I've set for my own life. Total failure only means that our operations are completely shut down and no one is left able to continue them. It could come from illegitimate interventions or from circumstances nobody caused on

purpose. Illegitimate interventions are those that rely on moral evil, unlike rules that are open and apply to everyone.

Our aim is to build something better than the current world order, starting small and proving each step, until enough people see for themselves that it is better and choose it. That is how it becomes the new standard the world holds itself to. Many of history's most lasting changes came from people choosing something better, not from force. As the vision comes to reality, I wish for everybody to easily find a place in their life where they can live and work in their zone of genius and in what makes them truly happy without worrying about money, fame, status, or other social markers.

Let's focus on the work that leads to the vision.

PART II: THE OPERATIONAL ROUGH PLAN

This plan is the first mechanism for the vision, starting with trade between businesses. We are building many durable, interconnected local trade unions that exchange high-quality products and services strictly on moral good, work better for the people inside them, and remain permanently open for anyone who chooses to join.

The platform we offer is an open, autonomous **liquidity and trade-netting network infrastructure**. It delivers three core layers of capability to participants:

1. **The Core Operational Engine:** Automated multilateral obligation clearing (canceling circular invoice debt cycles without interest or bank debt), mutual credit integration for residual balances, and an open, privacy-preserving ledger for verifiable corporate standing, transparent credit health (without exposing proprietary trade secrets), and portable reputation.

2. **Governance & Legal Enablement:** Pre-packaged regulatory sandbox frameworks (confirming non-taxable debt netting), decentralized peer-jury dispute resolution, and moral-good standards.

3. **Ecosystem Growth & Capability Support:** High-value business advisory and offer-optimization frameworks (facilitated by domain partners) to help member enterprises scale their own high-quality products and services.

The vision is a world where everyone is safe, free, and treated fairly, and able to grow, belong, and contribute. We build it through a global economic system where society advances through high-quality products and services built strictly on moral good (like honesty, consent, fairness, kindness, and respect), so that moral evil (like deception, exploitation, coercion, theft, and violence) becomes reliably unprofitable, low-status, and rare.

This vision is the core. Every phase, every partnership, and every decision, no matter how small or how urgent, must be true to the vision. Where a choice would make things faster but would require moral evil, even against a single person or AI, the vision comes first.

The vision also has to outlast anyone working on it, including me. I don't have all the right knowledge to build every part myself. I am laying out these operational principles for myself, but I'll let domain experts with proven knowledge and results lead their respective areas.

Research Foundation & Real-World Proof

When looking for proof that multilateral debt clearing works at national scale, the benchmark to study is Slovenia in 1991 (researched thoroughly by Tomaž Fleischman).

Following independence, Slovenia faced severe inflation and debt cascades across a population of ~1.9 million people with a GDP of ~$13.83 Billion USD. By deploying a national-scale multilateral obligation clearing system (TCT/Tetris Core Technologies), they neutralized internal debt cycles ($A \to B \to C \to D \to A$). In its very first year, this saved approximately **7.5% of national GDP** in freed-up liquidity without borrowing a single dollar or printing central bank money.

Research on scale-free trade networks shows that global trade volume is governed by a Power Law distribution rather than an even, linear spread. A core of ~150 to 300 dense, highly interconnected B2B suppliers provides the smallest viable unit to find initial closed cycles, while capturing ~3,000 deeply interconnected B2B hub nodes unlocks network-wide liquidity clearing across an entire national industrial corridor.

Irreducible Constraints

To keep the work honest and durable, everything has to satisfy a few irreducible constraints:

- **Voluntary Exchange:** Value has to be produced and exchanged voluntarily — coercion and deception are off the table by definition, so the only real engine is products and services people actually prefer because the outcomes are better for them.
- **Local Trust:** Trust is local and expensive. Large-scale coordination without local knowledge and repeated interaction tends to collapse into free-riding or hidden moral evil. Global ledgers and shared standards can amplify local trust; they cannot create it.
- **Incentives Dominate Behavior:** If moral evil still yields higher private returns inside or outside the system, it will happen. The design itself — transparency of standing, reputation costs, closed trade unions that start with real mutual need, and clear exit rights — has to make moral good the higher-return path.
- **Money & Credit as Coordination Tools:** Money and credit are tools for coordination, not ends in themselves. Changing the global monetary order is useful only when it lowers the cost of honest, consensual exchange. Pure replacement is extremely hard because of network effects and incumbent power; complementary systems that demonstrably outperform on working capital and quality have a better chance.
- **No Single Point of Failure:** There can be no single point of failure, including people. Anything that depends on one leader, one company, or one fixed definition of the standard will eventually fail. Durability needs open protocols, local voting on standards, portable reputation, and distributed competence.

- **Legal Reality:** Legal and physical reality still exists. States keep the monopoly on legitimate violence and the power to regulate money and credit. Whatever we build has to interface with existing law without itself relying on coercion.

Governance & Operational Safeguards

To ensure long-term stability and prevent institutional capture or hostile shutdown as the network expands across supply chains and borders, every local union incorporates four foundational governance and defensibility guarantees:

- **Local Union Dispute Resolution (Peer Arbitration):** Commercial disagreements, delivery discrepancies, and good-faith operational disputes do not rely on expensive state courts or centralized arbitration boards. Instead, they are resolved locally via decentralized peer juries chosen by local union voting, ensuring disputes are settled quickly through reputation, transparency, and peer mediation.

- **The Guaranteed Right of Clean Exit (Anti-Lock-In Architecture):** To prevent the network from ever becoming a coercive monopoly, every participant maintains an absolute right of clean exit. Any business can settle its net balance, exit the union at any time without penalty, and take its cryptographic reputation and transaction history seamlessly with them to alternative systems.

- **Resilience Against Incumbent Pushback (Legal Trojan Horse):** Because every transaction within the clearing engine complies fully with e-invoicing standards, tax reporting frameworks, and central bank regulatory sandboxes (e.g., Operator of Payment Systems licensing), legacy financial institutions and corrupt entities cannot legally obstruct or dismantle the network without challenging sovereign tax and commercial codes themselves.

- **The Asymmetric Supplier Wedge (The Bottom-Up Synthetic Hub):** We do not rely on hostile or corrupt top-level conglomerates joining the network on day one. If corrupt elites control the top tier and refuse to adopt moral-good standards, we organize the dense layer of 150 to 300 mid-tiered B2B suppliers underneath them (Tier-2/3 manufacturers, logistics providers, packaging, and raw material suppliers).

    - **Addressing the Sub-Tier Interconnection Flaw:** A common critique of mutual credit is: *"What if suppliers only sell UP to the conglomerate and never to each other?"* In real industrial economics, businesses do not exist in isolated silos. While a bottle manufacturer, trucking company, and packaging firm all sell their final product *up* to a major drink conglomerate, **they constantly buy industrial inputs from one another underneath the surface** (e.g., industrial electricity, raw resin, factory maintenance, diesel fuel, spare tires, fleet insurance, packaging ink, and forklift leases).

    - By capturing this sub-tier depth and clearing operational debt directly among themselves ($A \rightarrow B \rightarrow C \rightarrow A$), these suppliers eliminate their reliance on high-interest bank debt and survive delayed payment terms indefinitely. This forms an un-crushable "Synthetic Hub" that eventually forces top-tier buyers to interface with the ledger on the union's terms to secure real physical supplies.

The Foundation Hierarchy

These constraints define the foundation. New weight should only be added once the foundation has been proven strong enough at the current scale to carry it. In practice, the foundation holds these elements, in this exact order of priority:

1. **Proven local closed trade unions** that deliver real economic value — better liquidity, higher-quality goods and services, zero interest costs — under the moral-good standard, making moral evil structurally unprofitable inside them.

2. **Clear, locally adopted definitions of the standard**, enforced only by peers who know the parties, with corporate obligations, invoices, standing, and debt cycles 100% transparent across the union network so hidden debts, double-pledging, and secret insolvencies cannot exist.

3. **Sustainable revenue** generated directly from the productive commercial activity and high-quality products and services operating within those unions, rather than relying on grants or outside venture capital as long-term fuel.

4. **Technical infrastructure** (ledger and clearing engine) that stays open, non-capturable, and privacy-respecting, ensuring reputation and credit history travel without trapping anyone.

5. **Legal interfaces** that keep the system compliant and fully authorized in every operating jurisdiction.

6. **A culture** in which the network standard is experienced as simply better, not as something imposed from above.

Phased Rollout Plan & Global Expansion

The rollout follows a strict growth model: prove the smallest viable unit in a single jurisdiction first, achieve local density, expand across the nation, extend to neighboring countries on the same continent, and finally federate globally across multiple continents. We use the Philippines as our initial proving ground because this is where I am currently living. If someone joins early whose location offers a superior proving ground, we will adapt accordingly.

Phase 0: Provisional Standard & Legal Groundwork

Phase 0 is simply drafting a provisional standard defining moral good and moral evil, along with concrete tests showing moral evil is not profitable inside a union. This draft has no binding force until a local union votes to adopt it.

- **Legal & Tax Groundwork:** Secure regulatory sandbox clearance under national payment system acts (e.g., BSP / NPSA as an Operator of Payment Systems in the Philippines) alongside tax rulings (e.g., BIR in the Philippines) confirming that transparent multilateral obligation netting against verified e-invoices is valid, non-taxable debt settlement.

- **Supply Chain Matrix Audit & Dense Core Recruitment:** Conduct a rigorous input/output dependency audit to identify and recruit a complementary core of 150 to 300 tier-1, tier-2, and tier-3 B2B suppliers.
    - **Mathematical Screening:** We do not recruit random suppliers. We map their operational expenses (fuel, logistics, maintenance, packaging, raw materials) against each other's outputs.
    - **The Closed-Cycle Threshold:** We **ONLY** launch Phase 1 once graph analysis proves that at least 50% of the trade volume inside that group forms closed debt cycles. If internal trade is insufficient, we keep adding complementary local businesses (e.g., local fuel distributors, commercial landlords, industrial electricians) until cycles activate.

Phase 1: One Local Area in One Country

We start with the smallest viable unit: a single closed trade union in one local area, anchored by our dense complementary core of 150 to 300 suppliers.

- Members agree that invoices and corporate obligations are 100% visible on the open ledger.
- Automated cycle-finding algorithms run across the graph to cancel matching debt cycles.
- **Handling Residual Conglomerate Invoices:** For remaining un-netted balances (e.g., where a conglomerate owes a supplier $100,000 on a 120-day delay), even if internal netting clears $40,000 of their operational expenses (fuel, parts, maintenance) without bank debt, the union provides a zero-interest mutual credit backstop against the verified e-invoice. This gives the supplier immediate working capital relief and removes the desperation that makes them vulnerable to legacy financial exploitation.

Phase 2: Many Local Areas in One Country (Nationwide B2B Scale)

Once Phase 1 is proven in a single cluster, local trade leaders across other industrial areas in the same country replicate the Phase 1 blueprint in parallel. Once multiple independent clusters are active, Phase 2 connects them nationwide.

- Growth scales across independent supply-chain corridors, absorbing extended supplier networks and regional trade nodes while bypassing legacy conglomerate bottlenecks.
- **The Outcome:** Unlocks massive permanent working capital across the domestic economy, proving the model can scale beyond a single cluster to a national industrial level.

Phase 3: Many Local Areas in Many Countries in One Continent (Cross-Border Corridors)

Once the Phase 1 blueprint is proven in a single cluster in one country, local trade leaders in neighboring countries on the same continent can immediately replicate it in their own domestic markets, launching Phase 2 in their nations as soon as Phase 1 is validated. As independent domestic clusters

activate across the continent, Phase 3 connects these active ledgers across **cross-border trade corridors** (such as maritime, raw material, and manufacturing links between adjacent nations on the same continent).

- **The Outcome:** Connects industrial SME clusters across neighboring sovereign borders, aggregating heavy cross-border invoice volume and proving multi-country obligation netting without foreign exchange exploitation, correspondent banking fees, or delayed letters of credit.

Phase 4: Many Local Areas in Many Countries Across Multiple Continents (Global Scale & Tipping Point)

Once cross-border netting is established within an initial continental block, we connect these trade networks **across multiple continents**, applying our established local peer-dispute resolution and clean exit guarantees across every participating node:

- **ASEAN & RCEP (Asia-Pacific Anchor):** Scale from Southeast Asia across the broader Regional Comprehensive Economic Partnership (China, India, Japan, South Korea). Asia holds over 48% of global GDP (PPP) and controls the world's densest B2B manufacturing supply chains.

- **USMCA (North American Corridor):** Bridge Asian manufacturing loops to North American importers (United States, Mexico, Canada), allowing major corporate buyers to clear international liabilities without working capital delays.

- **European Union & Global Markets:** Expand across the EU single market by integrating directly with existing electronic invoice standards (e.g., Peppol), followed by Latin America, the Middle East, and Africa.

Across these continents, automated multilateral obligation clearing and mutual credit runs across international supply chains (e.g., Supplier [PH] → Manufacturer [CN] → Distributor [US] → Exporter [PH]).

Reaching the Global Tipping Point

By scaling this model across international trade corridors, the network reaches its ultimate global tipping point: securing roughly **50% of core commercial trade volume** (~1.8 million to 3.6 million core enterprises globally, representing the top 0.5% to 1.0% of operating companies that control the bulk of global supply-chain velocity).

We do not reach 50% volume by attempting to build millions of new companies from scratch or fighting a direct political war against corrupt elites. Instead, migration happens through **irresistible economic physics**:

- **The Scale-Free Power Law:** In global B2B trade, securing the top 1% of high-density industrial hubs automatically pulls their multi-tiered network of suppliers onto the ledger to unlock instant liquidity.

- **The Unbeatable Cost Advantage:** Businesses operating inside the union clear working capital at **0% interest overhead**, while legacy competitors remain burdened by 12%–18% bank financing costs, credit card fees, and 90-day payment delays. In competitive markets, this 10%+ yield advantage is an insurmountable operational edge. Legacy enterprises migrate to the moral-good network not out of sudden idealism, but because staying in the extractive debt system means economic insolvency.
- **Physical Reality Backstop:** Because the network clears obligations for real physical producers (steel, agriculture, fuel, transport, components), legacy financial cartels cannot "crush" or outlaw the network without halting physical supply chains and destroying their own domestic tax base.

Execution & Domain Partnerships

To move through these phases, I need to partner with extraordinarily capable leaders across specialized domains. The network itself is not a traditional commercial vendor selling consumer products; it is an open trade infrastructure — delivering automated multilateral clearing, mutual credit, legal/tax compliance sandboxes, and decentralized governance.

Leaders operating within this ecosystem function inside the exact same consensus process everyone else follows. Their speed comes from being excellent at proposing, building, and executing infrastructure and member capabilities, never from any authority to bypass local union votes.

I do not want to be the leader everyone follows. I expect many domain leaders to gather around the work, each leading through their own work.

Among the leaders I would like to partner with are Alex and Leila Hormozi. My intent is to connect this network infrastructure with their strategic expertise so they can help the member enterprises inside the trade unions build, scale, and deliver superior products and services strictly under moral-good principles. Having consumed over four thousand hours of their material, I view them as among the finest business minds of our generation who prioritize genuine customer value over short-term extraction. If they do not participate, we will engage other leaders capable of fulfilling the same role. Their contribution, or that of any equivalent partner, is valued strictly for strengthening the operational capability of network members, never as a central authority.

To discover and build deep personal relationships with these partners, we focus on two practical steps: mastering their primary language and cultural context at a functional level, and securing the resources required to reach them reliably while empowering them to excel in their domains.

Generating sustainable financial throughput — while deeply caring for people — is how every phase expands. Money is a coordination tool for the vision, not an end in itself. While initial development may utilize startup grants, the network will never depend on outside capital or central funding to survive. Once operational, network sustainability flows directly from the economic value generated by the high-quality products and services exchanged by member businesses across our closed trade unions.

We will solve every hard problem sequentially with those who join — never expanding beyond what is empirically proven, treating every unvalidated incentive or legal interface as a foundational gap to be

closed, and ensuring the Phase 0 provisional standard remains a flexible proposal that local union votes can continually refine.

PART III: WHY DO I WANT TO WORK ON THIS VISION?

I'll first talk about my personal reason, then I'll touch on the defensive reason, the inspiration reason, and my hypothesis on why this can scale faster than expected.

1. Personal Reason

I have many painful experiences that cause the excruciating pain of misery I'm constantly in. Here are some:

- **Family Betrayal:** When I was six years old, my father left us from the Philippines, went to the US, and didn't come back. Later on, we found out he's with another woman already. Our family is not well-off, so I assume one reason he betrayed us is because of money.

- **School as an Extractive Business:** Growing up, I followed my mom's advice to do well in school and graduate with honors so that "I'll be able to get a high-paying job". I did graduate with honors but all the entry-level jobs in the Philippines were low-paying. We didn't have the idea of me getting work overseas. All my skills were optimized on "graduating with honors", not on "getting a high-paying job". Later on, I understood that schools are businesses themselves. Many of them operate to maximize profits, and put up a facade to care about students and teachers, but in reality, they only care about money, not people.

- **Corrupt Work Practices:** In my job as a structural engineer, my boss talked to me in private forcing me to just let the failed structure seem like it passes so that we can submit the long-overdue project and get paid. He said he would be the one to take the blame if ever something bad happens to the structure once built. He only cared about the money, not the people who would die if the structure actually fails.

- **Exploitative Work:** I've had four different digital freelancing jobs that collectively were paying me 20x of my one engineering job. To keep the story short, despite being in different industries and different places around the world, all of them only cared about the money, not their employees and not the people they're serving.

- **Work Fraud:** My mom decided to get our first house built by a contractor she personally knew. I trusted my mom with her judgement and didn't bother prying into the specifics of her deal with the contractor because I was busy working 4 jobs. Later on, we found out that the contractor was a fraud and he disappeared one day when he got full payment, without even finishing the home.

One recurring theme in these five experiences was that many people only care about money, not others. Many people only care about themselves and their loved ones, not others. I realized this is how money influenced and set the norms of society. Money, fame, status, and power aren't evil in themselves. They're tools, and the problem is people who use them for moral evil and get away with it, or who care about these tools more than they care about people. It's scary to think that as society

progresses, more and more people would care only about money tied with fame, status, power or other social markers. I don't want this to happen.

This might sound extremely selfish... but it’s best for me to be honest. One big reason I want to work on this vision is to save myself from this aching feeling of misery.

- I hate that everywhere I worked, my colleagues and/or boss only cared about money and it’s okay for others to fall just so that they could rise.
- I hate that everywhere I go, there are people who are rude to low-paid kind workers but respectful to high-paid arrogant workers.
- I hate that the government system, the work system, the school system, and all other global systems favor the ones who make the most money regardless if they’re doing moral evil to others.
- I hate that when I tried to ignore all of these and just lived my life, I felt empty. I tried working jobs that paid very low, and jobs that paid very high, but none of them made me happy. I went on vacations with my friends or with my mom, but I didn’t feel happy. Every single day, it’s like I’m alive... but I don’t feel like I’m living.

I hate this aching feeling of misery knowing that I can't change the way things are with the world because so much of the current system, and the people who benefit most from it, work to keep things as they are.

I want to change the world fast, and maybe as I'm doing the work, this feeling of misery would slowly go down, one union at a time, as more places uphold the standard of building high-quality products and services strictly on moral good. This is my personal reason.

2. Defensive Reason

As for the defensive reason of why it's useful for humans and society, having everyone choose to uphold the new standard meaningfully lowers the chances of humanity getting wiped out.

- **AI Alignment & Training Data:** If the norm everywhere in the world is to only do moral good, wouldn't that at least remove one contributing factor in whether AI trained on human data ends up misaligned with us? I know the leading argument in AI safety research says the bigger risk isn't what an AI has seen, it's that a sufficiently capable, goal-pursuing system can discover deception or self-preservation as useful strategies on its own, regardless of its training data, so this isn't a guaranteed fix. But a world that treats moral evil as never an option is still one less thing feeding whatever an AI learns from us.
- **Reducing Human Grievance & Existential Threats:** If the norm everywhere in the world is to only do moral good, wouldn't there likely be far fewer humans who'd want to see the human race wiped out? The painful experiences that many humans harbor in their hearts because of other people's moral evil is a real source of motivation for some to want to take revenge. Removing a major, active source of grievance should still meaningfully lower how many people end up there.

- **Multi-Planetary Risk:** Even if humans become a multi-planetary species and inhabit all planets possible, that wouldn't remove the risk that comes from moral evil. As long as moral evil is still accepted in the physical world, the chances of civilization getting wiped out remain elevated.

To be clear, moral evil causes suffering because someone else chose to do it. Natural evil is suffering that comes from the world itself, not from bad choices (like natural death, natural disasters, physical limits, grief, unrequited love, or honest failure). They say the path to wisdom is attained through struggle, pain, and failure. If moral evil becomes reliably unprofitable, low-status, and rare, humans, AI, and robots can still gain immense wisdom from the struggle and learning provided by natural evil.

Thus, the defensive reason is that upholding a standard of moral good improves the probable lifespan of civilization.

3. Inspiration Reason

Life cannot just be about solving one sad problem after another. There must also be things that make you excited to wake up in the morning, look forward to the future, and feel that life is worth living.

A world where moral good is the norm and moral evil is rare enables humanity to often experience this great feeling, no matter what they pursue. Right now, billions of people don't experience this, largely due to the compounding ripple effects of moral evil. The inspiration reason is to free everyone from those ripple effects so that doing moral good is finally enough to make life worth living.

I know the journey will be very hard, and there are many risks I need to take. The message I need to remind myself of most is: *"Never give up."* I'll live as long as humanly possible to make this vision a reality and uphold it until people all over the world embrace it as the better norm.

4. Hypothesis on Adoption Speed

My hypothesis for why this vision can turn into reality faster than expected is simple: **most people are not inherently a "good" or "bad" person.**

Our life outcomes are strongly shaped by the systems we inhabit. Many human systems today reward moral evil, making non-cooperative, extractive behavior the default strategy for survival.

As we build open infrastructure strictly on moral good that makes moral evil reliably unprofitable, low-status, and rare, human behavior will shift rapidly. People will not adopt it because they are told to be better. They will adopt it because it meets what humans need to live well in the long term: safety, freedom, fair treatment, growth, belonging, and the chance to contribute. Money and status often stand in for these needs. Inside the network, the needs are met more directly. As participants realize that practicing moral good lets them actually get more of what they genuinely want out of life, especially better relationships, adoption will compound faster than conventional wisdom predicts.

PART IV: MORE PERSONAL DETAILS

This section is miscellaneous and will evolve as I work on the vision.

Note that the information written here is just a tiny speck of who I am. You cannot assume that what's written here, or anything found on the internet, represents the full me. The only one who can fully understand me is me. Unless I have personally stated something in person or online, do not blindly believe what you see or hear from others about me. Get to know me personally on a genuine, deep level first, and then draw your conclusion.

Realizations & Philosophical Foundations

I grew up in a modest family in the Philippines and was taught to follow the standard script: study hard, get high grades, graduate with honors, and land a high-paying job. I did all of those things, but I didn't get a high-paying job or work I was proud of. Then the COVID-19 pandemic hit, accompanied by the painful experiences I outlined earlier.

These experiences forced me to think deeply about how the world actually works. I don't claim to know everything, but I realized there is a vast layer of reality that most people never get access to — information that incumbents benefiting from the status quo have little reason to share.

My first breakthrough came from studying Alex Hormozi. Though known as a business leader, the first content I saw from him was deeply philosophical and psychological. It opened my eyes: I had previously believed every domain was single-dimensional, but in fact everything is multi-dimensional. Business wasn't just about business; it had philosophical, psychological, behavioral and many other dimensions.

Breaking free from mental rules that flatten how you think and create became part of how I work. Since then, I've absorbed information from many world-class minds, but I don't follow anyone blindly. I use a strict framework: **take what's useful, discard the rest, and add what is uniquely my own.**

Personal Philosophical Guardrails & Self-Compassion

In navigating this work, I keep a few personal principles as my daily guide, inspired by thinkers like Eric Weinstein:

1. **Observe Reality Unfiltered:** See the world through your own eyes first before adjusting to consensus opinion. Much of legacy institutional life functions like scripted professional wrestling; recognizing this allows you to stay grounded in objective reality, even when called delusional by those trapped in old paradigms.

2. **Be of Good Cheer:** Stay genuinely excited and maintain joy in the work, regardless of the scale of opposition or the complexity of the problems.

3. **Grace for Human Imperfection & Honest Failure:** Perfection is an unviable standard in a complex world. We must not confuse honest human limits — fatigue, failure, or technical mistakes — with active moral evil. You are entitled to be human, to fail, and to make mistakes without fear.

4. **Practice Self-Compassion First:** In a digital era where mistakes are permanently recorded, extend deep compassion to yourself first. Only when you allow yourself room to be an imperfect

human being can you extend that same grace, patience, and compassion to others within the network.

Guided by these guardrails, I give myself permission to be human, to learn through honest failure, and to view legacy systems through an unfiltered lens without ever compromising on the standard of moral good or losing compassion for myself and others.

Priority, Boundaries, and Bonuses

I choose to do what's good for me first and foremost. What's good for me is the work that leads to the vision, so that is my primary priority. Everything else is either a strict boundary or an added bonus.

- **Non-Negotiable Boundaries:** My family, eating great food, and exercising. Wherever the work takes me, my family comes too — I will never leave the people I care about behind for the sake of the vision. Likewise, I will not sacrifice my well-being.

- **Added Bonuses (Not Priorities):** Digital gaming, watching anime/dramas/vlogs/learning reasources, reading manga/manhwa/manhua, and traveling the world with the people I care about while experiencing high-quality products and services.

To build this network, what I need most are people who believe in the vision, can manage themselves, possess the skills to execute work fast and excellently, and whom I genuinely enjoy working with. I will not work with people I don't like, regardless of how capable they are. That doesn't change who the vision is for; it only dictates who I choose to build it with day to day.

My Motivations

Apart from the personal, defensive, and inspiration reasons I mentioned before, here are my other motivations in no particular order:

1. Making My Mom Happy

I want to make my mom happy before she dies. She said that the biggest thing that'll make her happy is to see me succeed and do things that make me happy.

I've explained before that I've tried many things but none of them have made me constantly feel happy. I think the answer is a combination of work and relationships — specifically, work worth working, and genuine relationships built on moral good, not moral evil. I believe that as I'm working on the big vision, I'll meet like-minded people who want to do good to the whole world, not just to a small community.

What my mom actually wants is to see me succeed and be happy, and that is one part of the reason why I want to build this fast (while having a strong foundation). But I also want to give her something real — not because I owe it to her (she never asked for anything back), but because of how much she's given me without ever expecting it returned. For now, one of my short-term goals is to give her $500k to spend for herself. This money isn't for me. It's something I can give her, and I trust her to spend it on moral good.

2. Deprivation as Motivation

Next, I've come to understand that motivation is the opposite of deprivation, at least in part. We're more motivated to eat if we're deprived of eating. We're more motivated to sleep if we're deprived of sleeping. This isn't the whole story of what drives people — curiosity and novelty pull on us even without deprivation behind them — but the deprivation side of it is the part I feel most directly.

All my life, I've been deprived of seeing people do moral good genuinely. In so much of my experiences, across every place I've gone and any nationality I've interacted with, it has felt like there are more people doing moral evil than moral good, regardless of their wealth, status, fame, or other social markers.

My hypothesis is that one big reason why people choose moral evil — knowingly, unknowingly, or unintentionally — is because of the pain and suffering they got from others who did moral evil. The act of moral evil can have a ripple effect just like the act of moral good.

Quantitatively, I believe moral good happens exponentially more often than moral evil. However, moral evil possesses a disproportionate structural weight wherein a single act can echo across generations, making it feel as though evil dominates the world.

3. Breaking the 50,000-Year Cycle

All my life, I've experienced so much of the damage from these moral evil ripples that I feel so empty.

It feels like I've lived for fifty thousand years. It's like I've lived life after life, constantly being reborn, all the way to now. Each rebirth is a search for a place to belong. When I finally come across a place that feels like home, I still know deep down that it isn't where I truly belong. So I set off again, carrying that longing, and am reborn once more.

What does it take to break this cycle?

In this world, I believe leaving nothing to regret is the only way out of the cycle — so I'm no longer reborn. That means living this life so fully that I'm no longer searching for somewhere else to belong.

Working on this big vision is the only thing now that would not make me regret this life.

> **A Direct Call to Execution:** If you feel the same with anything I said in this document, and possess the skills to execute the hard operational problems outlined in this plan — such as running or governing community finance, managing fraud and risk, building transparent ledger software, or fitting our debt-clearing engines to national regulatory sandboxes — reach out to me directly.
