My Open Manifesto

Ray Dela Rama · ray@provensuccess.org · Information as of October 2026

I am writing this for myself first, driven by a vision of the future I'm committed to making real. Bringing this vision to life requires fast progress, yet the work will never move faster than the foundation can carry, so that the foundation is strengthened before each new weight arrives.

PART I: CORE PHILOSOPHY

Vision: A world where everyone is safe, free, and treated fairly, and able to grow, belong, and contribute.

How we build it: We design systems, norms, and incentives so that the easiest, most rewarding, and highest-status paths are those that create real value for others, through better tools, knowledge, experiences, relationships, and understanding. Society advances through high-quality products and services built strictly on moral good (like honesty, consent, fairness, kindness, respect). Moral evil (like deception, exploitation, coercion, theft, violence) becomes reliably unprofitable, low-status, and rare.

What this is not: This is not a call for perfect beings or a frictionless utopia. It is a design that makes moral good the path of least resistance and moral evil costly and unattractive. Someone's worth never depends on what they can produce.

Thesis: By removing the hidden costs of deception, exploitation, and other moral-evil defaults through local trade unions that use open debt clearing, fair dispute settlement, and a portable record of kept commitments, a moral-good trade network is designed to create a better economic life for participating communities, and we will demonstrate it step by step. Because it is designed to replace part of loan interest, payment bottlenecks, defensive overhead, and fraudulent waste with clearing and ledger transparency, we expect it to operate with greater economic efficiency, outcompeting extractive systems through operational superiority, without forcing anyone to participate.

The thesis is tested through empirical validation at each step, and we report the result either way:

1. **At the local scale**, by proving that closed-cycle debt netting clears frozen B2B trade credit, directly lowering working-capital costs for participating businesses.
2. **At the network scale**, by proving that radical ledger transparency, fair dispute settlement, and a portable record make fraud and corruption structurally unprofitable inside the union compared to the legacy economy.
3. **At the macro scale**, by demonstrating that a country can reach the point where a typical business not yet in the network gains more by joining than by staying out. Our working estimate for that point is roughly 50% of the country's core commercial trade volume, and each pilot will replace the estimate with a measurement. Beyond it, we expect joining to become the better choice for more and more businesses, so they join voluntarily, even where incumbents stay in unfair practices.

Core commercial trade volume is the total gross B2B transaction volume of supply-chain invoices paid between companies, not total sales, which also include sales to consumers, government, and exports. Across a whole economy, it is larger than a country's GDP because it counts every sale along a supply

chain, not only the value added at each step. In a country, the network's share is the volume of invoices between members (including members of different connected unions) divided by the country's total.

Here is what the thesis is designed to look like in plain everyday life. Each point is a hypothesis the pilots test:

- **Less Waiting to Get Paid:** Unpaid invoices in closed cycles cancel out automatically, giving businesses rapid relief room without taking on expensive bank loans. In the Italian data, that was about 25% of invoice value.
- **Cheaper to Run a Business:** Businesses that settle debts inside the network need less bank credit, so they pay less interest. How much less is what the pilots measure.
- **More Peace of Mind:** Full ledger visibility to members means you can see the standing of who you are dealing with, which makes hidden debts and scams much harder.
- **Protection in Hard Times:** If the broader economy freezes or experiences a cash shortage, clearing gives local businesses a way to keep settling debts with each other. In Slovenia, more firms used it in the 2012 crisis.
- **Higher-Quality Products and Services:** Because members choose a clear moral framework, products and services are built to serve human needs that improve lives for the short and long term.
- **Stronger Local Communities:** Value stays within the network and the local area, helping participating businesses grow, create work worth working and, ultimately, life worth living.

At a foundational level, moral evil, like fraud, coercion, deliberately delayed payments, and deception, acts as heavy friction on human output. It forces society to waste massive time, energy, and capital on defensive overhead like lawsuits, bank interest, middleman audits, and risk premiums just to protect against betrayal. When trade is anchored strictly in moral good, that systemic friction shrinks sharply. Human effort converts far more efficiently into real productivity. **Higher productivity expands real economic output, allowing society to solve hard problems, advance technology, raise quality of living, and move civilization forward faster, safer, and with far less wasted human suffering.**

About Me

To turn the vision into reality, I'll be completely honest: I have no achievements online that prove I am fit to work on making this vision a reality. But a key framework I apply to all my work is to observe what people far ahead of me are doing, take what's useful, discard the rest, and add something of my own.

I'm determined to make this work, alongside trusted individuals who share the vision and have the skills and motivation to work on it. I am sharing my plans openly to attract capable leaders with an extraordinary sense of responsibility, strong ambition, relentless curiosity, and a genuine concern for where this work leads. I'm not looking for anyone to manage: I expect every leader to manage themselves and lead through their own work.

For myself, I don't value money, fame, status, power, or other social markers for their own sake. I value them only as tools, for making this vision real and for the people I care about and work with, if they want them. Tools can be used for moral good or moral evil, and I will use them only for moral good.

More broadly, I'll do everything I need, using only morally good means, to make this vision real and prevent total failure, but never at the cost of who I want to be or the boundaries I've set for my own life.

Total failure only means that our operations are completely shut down and no one is left able to continue them. It could come from illegitimate interventions that rely on moral evil or from circumstances nobody caused on purpose.

The aim is to build something better than the current world order, starting small and proving each step, until enough people see for themselves that it is better and choose it. That is how it becomes the new framework the world holds itself to. Many of history's most lasting changes came from people choosing something better, not from force.

As the vision comes to reality, I wish for everybody to easily find a place in their life where they can live and work in their zone of genius and in what makes them truly happy without worrying about money, fame, status, or other social markers.

Let's focus on the work that leads to the vision.

PART II: ROUGH PLAN

This plan is the first mechanism for the vision, starting with trade between businesses. We do not yet know whether it alone reaches the vision. Teaching moral good from a young age is a separate piece of work that software cannot replace, and we will work on it alongside this plan. We are building many durable, interconnected local trade unions that exchange high-quality products and services strictly on moral good, work better for the people inside them, and remain permanently open for anyone who chooses to join.

Terms used here: a local area is a place where businesses trade heavily with each other, whether or not they have joined. The core is the 150 to 300 businesses recruited in one local area. A union is the businesses, starting in one local area, that joined and accepted the same frameworks. A country is all businesses in one country.

The platform we offer is an open, autonomous **network for debt clearing**. Its software is open source. The live debt map, dispute settlement, and record work only among members of a union. It delivers four capabilities to participants:

1. **Automated Debt Clearing and the Debt Map:** Multilateral clearing cancels interlocking invoice cycles without interest or bank loans. The debt map shows each member who owes them, whom they owe, how late each debt is, and which debts sit in cycles. Before joining, a business gets a free, private audit of its past invoices, which is the debt map run on past data.
2. **Fair Dispute Settlement:** When two sides disagree about an invoice, each adds evidence. Peers chosen by local union vote, unconnected to either side, record the best-supported answer with its reasons. Each fact is labeled as confirmed by both sides, confirmed by an independent record, or contested. A finding is not absolute truth: it stays open to appeal if new evidence appears.
3. **A Portable Record of Payment Commitments:** An open, privacy-preserving ledger records which commitments were kept and broken (paid on time, paid late, unpaid, cancelled in a cycle, and how any dispute was settled). The member owns the record and takes it along when leaving. It holds payments only until peer juries have shown fair findings.
4. **Governance and Legal Enablement:** Pre-packaged legal and regulatory frameworks (including formal netting structures and registration models to be verified with counsel and tax authorities) and the moral-good framework, set by local union votes.

The vision above is the core. Every phase, every partnership, and every decision, no matter how small or how urgent, must be true to the vision. Where a choice would make things faster but would require moral evil, even against a single person or AI, the vision comes first.

The vision also has to outlast anyone working on it, including me. I don't have all the right knowledge to build every part myself. I am laying out these operational principles for myself, but I'll let domain experts with proven knowledge and results lead their respective areas.

Research Foundation and Real-World Proof

When looking for proof that multilateral debt clearing works at national scale, the benchmark to study is Slovenia, which began clearing in 1991 (documented by Tomaž Fleischman and co-authors in Fleischman, Dini and Littera, 2020).

Following independence, Slovenia faced inflation of almost 250% in 1991, falling output (GDP fell 8.9% in 1991 and 5.4% in 1992), and debt cascades between firms. By deploying a national-scale multilateral debt clearing system (TCT/TETRIS Core Technologies, developed by Be Solutions, the lead author's company), they neutralized internal debt cycles (A→B→C→D→A). In 1992, its first full year of operation, **this cancelled debts between firms equal to 7.58% of national GDP through non-monetary set-off**. Use is counter-cyclical: it rose to 8.3% of firms (1.89% of GDP cleared) in the 2012 crisis and eased to 1.2% of firms (0.5% of GDP) in 2019 as growth returned. The authors read that as relief working as intended: it is there when money is scarce. **Our network aims to add day-to-day value on top, through ledger transparency, fair dispute settlement, and a record of kept commitments, so members stay when conditions are good.**

Firm-level supplier networks, such as a Japanese network of about one million firms and four million links (Fujiwara and Aoyama, 2010), show a heavy-tailed, scale-free spread of suppliers and customers per firm: a few hubs with very many links and many firms with few. The same study notes that each supplier link is also a creditor-debtor link. This measures links, not trade volume. A core of about 150 to 300 dense, highly interconnected suppliers is our working estimate of the smallest viable unit to find initial closed cycles. It is an estimate, not a published finding. How many firms are needed for clearing to work across a whole country is not yet known, and each pilot will measure it. A practitioner has said 50 to 100 well-connected businesses can be enough (Lowimpact, 2023).

Irreducible Constraints

To keep the work honest and durable, everything has to satisfy a few irreducible constraints:

- **Voluntary Exchange:** Value has to be produced and exchanged voluntarily. Coercion and deception are off the table by definition, so the only real engine is products and services people actually prefer because the outcomes are better for them.
- **Local Trust:** Trust is local and expensive. Large-scale coordination without local knowledge and repeated interaction tends to collapse into free-riding or hidden moral evil. Global ledgers and shared frameworks can amplify local trust; they cannot create it.
- **Incentives Dominate Behavior:** If moral evil still yields higher private returns inside or outside the system, it will happen. The design itself (transparency of standing, reputation costs, closed trade unions that start with real mutual need, and clear exit rights) has to make moral good the

higher-return path. Closed trade union means clearing runs only among a union's current members; anyone who accepts the frameworks can join, and anyone can leave.

- **Money as a Coordination Tool:** Money is a tool for coordination, not an end in itself. Changing the global monetary order is useful only when it lowers the cost of honest, consensual exchange. Pure replacement is extremely hard because of network effects and incumbent power; complementary systems that demonstrably outperform on working capital and quality have a better chance. This network does not set out to replace legal money. It settles part of what businesses owe each other without bank money, so they need less bank credit. If it grows beyond that, it is because businesses chose it, and each pilot measures how far.
- **No Single Point of Failure:** There can be no single point of failure, including people, including a single large member. Anything that depends on one leader, one company, or one fixed definition of the framework will eventually fail. Durability needs open frameworks, local voting on frameworks, portable reputation, and distributed competence.
- **Legal Reality:** Legal and physical reality still exists. States keep the monopoly on legitimate violence and the power to regulate money and credit. Whatever we build has to interface with existing law without itself relying on coercion. The right legal form, such as a member-owned cooperative, is confirmed with counsel.

Governance and Operational Safeguards

To ensure long-term stability and prevent institutional capture or hostile shutdown as the network expands across supply chains and borders, every local union incorporates four foundational governance and defensibility guarantees:

- **Local Union Fact-Finding (Peer Arbitration):** Commercial disagreements, delivery discrepancies, and good-faith operational disputes do not rely on expensive state courts or centralized arbitration boards. They are settled locally by peer juries chosen by local union voting. Each side adds evidence, each fact is labeled by how well it is known, and the finding records the best-supported answer with its reasons. A finding stays open to appeal. A fair process can still reach a wrong answer, so we label what is verified and what is contested instead of claiming absolute truth.
- **The Guaranteed Right of Clean Exit (Anti-Lock-In Architecture):** To prevent the network from ever becoming a coercive monopoly, every participant maintains an absolute right of clean exit. Any business can settle its net balance, exit the union at any time without penalty, and take its cryptographic reputation and transaction history seamlessly with them to alternative systems.
- **Resilience Against Incumbent Pushback (Compliance by Design):** Our design goal is that every transaction within the network complies with e-invoicing frameworks, tax reporting frameworks, and central bank payment-system frameworks. The Phase 0 legal work settles whether that is achievable. If the path is confirmed, legacy financial institutions and corrupt entities could not legally obstruct or dismantle the network without challenging sovereign tax and commercial codes themselves.
- **The Asymmetric Supplier Wedge (The Bottom-Up Synthetic Hub):** We do not rely on hostile or corrupt top-level conglomerates joining the network on day one. If they do not adopt the framework, we organize the dense layer of 150 to 300 mid-tiered B2B suppliers underneath them, expected to be mostly owner-managed small and medium firms (Tier 2 and Tier 3 manufacturers, logistics providers, packaging, and raw material suppliers). Membership depends

on how a business trades, not on its size. Size only guides who we recruit first, because small and medium firms feel late payment most and can decide quickly. Any business, large or small, that accepts the same frameworks can join, and no member is above them. Each union sets, by member vote, a limit on how much of its volume any one member can hold, so a large member cannot set terms for the rest. A large firm joins only after these frameworks have been tested in a live union.

- **Addressing the Sub-Tier Interconnection Flaw:** A common critique is: "What if suppliers only sell up to the conglomerate and never to each other?" In real industrial economics, businesses do not exist in isolated silos. A bottle manufacturer, trucking company, and packaging firm all sell their final product up to a major drink conglomerate, yet they constantly buy industrial inputs from one another (e.g., industrial electricity, raw resin, factory maintenance, diesel fuel, spare tires, fleet insurance, packaging ink, and forklift leases). In the Italian Sardex invoice data, 3,195 of 3,199 firms formed one strongly connected group, so every supply chain sat inside cycles. That network is partly built that way, since members are encouraged to trade inside it, so any local area on our network must show it independently.
- By clearing operational debt directly among themselves, these suppliers reduce their reliance on bank loans and can better withstand delayed payment terms. This could form a resilient "Synthetic Hub" that may draw top-tier firms to interface with the ledger on the same frameworks as every member. In the Sardex data, clearing alone cancelled about 25% of invoice value (Fleischman, Dini and Littera, 2020).

The Foundation Hierarchy

These constraints define the foundation. New weight should only be added once the foundation has been proven strong enough at the current scale to carry it. In practice, the foundation holds these elements, in this exact order of priority:

1. **Proven local closed trade unions** that deliver real economic value (cash freed from unpaid invoices, less interest paid) under the moral-good framework, making moral evil structurally unprofitable inside them.
2. **Clear, locally adopted definitions of the framework**, upheld only by peers who know the parties, with corporate debts, invoices, standing, and debt cycles 100% transparent across the union network so hidden debts, double-pledging, and secret insolvencies cannot exist.
3. **Sustainable revenue** generated directly from the productive commercial activity within those unions, rather than relying on grants or outside venture capital as long-term fuel. The only fee is a small share of the value cleared, as the Slovenian system charges (Fleischman, Dini and Littera, 2020). No cancelled debt, no fee. There are no ads and no sale of member data. The fee has to stay well below what clearing saves a member, and across the network it has to cover the cost of serving current members, finding new ones, keeping all members transacting inside the network, and opening new areas to expand the network.
4. **Technical infrastructure** (ledger, clearing, debt map, and dispute software) that stays open, non-capturable, and privacy-respecting. It records every invoice as an amount with its currency code and has no network unit of its own, so that reputation travels without trapping anyone.
5. **Legal interfaces** that keep the system compliant and fully authorized in every operating jurisdiction.

6. **A culture** in which the network framework is experienced as simply better, not as something imposed from above.

Phased Rollout Plan and Global Expansion

The rollout follows a strict growth model: prove the smallest viable unit in a single jurisdiction first, achieve local density, expand across the nation, extend to neighboring countries on the same continent, and finally federate globally across multiple continents. We use the Philippines as our initial proving ground because this is where I am currently living. If someone joins early whose location offers a superior proving ground, we will adapt accordingly.

The first mechanism is trade between businesses. Individuals and AI agents can join the same network later, after each member is tied to a real owner so a bad record cannot be dropped and restarted. Each form of joining is put to counsel first.

Phase 0: Provisional Framework and Legal Groundwork

Phase 0 starts with drafting a provisional framework defining moral good and moral evil, along with concrete tests showing moral evil is not profitable inside a union. This draft has no binding force until a local union votes to adopt it. Phase 0 also proves the idea before any money moves or production software is built. In the grant proposal, Phase 0 is Stages 1 and 2. If a claim fails, we stop or redesign and report before spending on the next step.

- **Legal and Tax Groundwork:** Obtain written legal opinions on whether the service must register as a payment system operator under the National Payment Systems Act (Republic Act 11127, with the BSP in the Philippines). Prepare and submit the registration and tax-ruling filings (e.g., to the BIR) on whether transparent multilateral debt netting against verified e-invoices is valid, non-taxable debt settlement. Phase 1 launches only on the legal path counsel confirms. Approval timing is outside our control.
- **Supply Chain Matrix Audit and Dense Core Recruitment:** Conduct a rigorous input/output dependency audit across two or three candidate local areas, choose the one with the densest trade among its own businesses, and identify and recruit a complementary core of 150 to 300 tier 2 and tier 3 B2B suppliers in it, expected to be mostly owner-managed small and medium firms.
    - **Mathematical Screening:** We do not recruit random suppliers. We map their operational expenses (fuel, logistics, maintenance, packaging, raw materials) against each other's outputs, and measure what share of each firm's purchases other members can supply and what share of its sales go to other members, because clearing needs members who both buy from and sell to each other.
    - **The Break-Even Threshold:** We **ONLY** launch Phase 1 once an audit of the group's real invoices shows that clearing saves a typical member more than it costs to join and run the network. The pass mark is written down with advisors before the audit runs, and the share of what members owe each other in closed cycles is measured and reported alongside it. For reference, an analysis of real invoices from the Italian Sardex network found about 23% of what businesses owed each other in closed cycles. If internal trade is insufficient, we keep adding complementary local businesses (e.g., local fuel

distributors, commercial landlords, industrial electricians) up to a limit written down beforehand, then try the next candidate local area. We report the result for the naturally occurring group separately from the result after additions, because a group built to pass proves less than one that was found. Below a written minimum number of firms and invoices, a low result is reported as inconclusive, not as a failure.

- **Demand Check:** Interview 20 to 30 business owners and finance staff, asking about clearing, what would make them confirm an invoice they owe, and what limits their sales most, and secure at least 5 written data-sharing agreements before the audit.
- **Prototype:** Test a prototype of the calculation core on synthetic data with planted debt cycles (all must be found, and none invented). Run the audit on real invoice data under confidentiality, with no money moving. Each firm that shares data receives a free, private report of its own result.

Phase 1: One Local Area in One Country

We start with the smallest viable unit: a single closed trade union in one local area, anchored by our dense complementary core of 150 to 300 suppliers. The first live step is to start the union with 3 to 20 core members, only after the software passes its tests and an independent security review and counsel confirms the legal path. The union starts with clearing, the live debt map, simple fact-finding for invoice disputes, and the payments-only record. The union widens to the full core once clearing works and the frameworks limiting one member's weight hold.

- Members agree that invoices and corporate debts are 100% visible to the other members of the union on the open ledger, not to the public. The network itself sees every balance. Before a business joins, its data stays anonymous and confidential.
- Automated cycle-finding algorithms run across the graph to cancel matching debt cycles.
- The fee starts here: a small share of the value cleared.

Phase 2: Many Local Areas in One Country (Nationwide B2B Scale)

Once Phase 1 is proven in a single union, local trade leaders across other industrial areas in the same country replicate the Phase 1 blueprint in parallel. Once multiple independent unions are active, Phase 2 connects them nationwide. The record travels between unions only after peer juries have shown fair findings. Growth scales across independent supply chains, absorbing extended supplier networks and regional trade nodes while bypassing legacy conglomerate bottlenecks.

The Outcome: Aims to unlock working capital across the domestic economy (to be measured union by union), testing whether the model can scale beyond a single union to a whole country.

Phase 3: Many Countries on One Continent (Cross-Border Connections)

Once the Phase 1 blueprint is proven in a single union in one country, local trade leaders in neighboring countries on the same continent can replicate it in their own domestic markets as soon as Phase 1 is validated there. As independent domestic unions activate across the continent, Phase 3 connects these

active ledgers through links between unions in different countries (such as maritime, raw material, and manufacturing links between adjacent nations).

The Outcome: Tests whether multi-country debt netting can reduce reliance on foreign exchange conversion costs, correspondent banking fees, and delayed letters of credit. Each union counts invoices in its own legal currency. Phase 3 also tests how a cycle that crosses currencies is cancelled (the starting assumption is conversion at a published market rate on the clearing date).

Phase 4: Many Countries Across Multiple Continents (Global Scale and Tipping Point)

Once cross-border netting is established within an initial continental block, we connect these trade networks across multiple continents, applying our local peer dispute settlement and clean exit guarantees across every participating node. Which countries come first is decided then, from the evidence of the earlier phases. Possible anchors are ASEAN and RCEP in Asia-Pacific (China, Japan, South Korea, Australia and New Zealand, alongside the ten ASEAN members), USMCA in North America, and the European Union through existing electronic invoice frameworks (e.g., Peppol), followed by Latin America, the Middle East, and Africa.

Reaching the Global Tipping Point

The tipping point is defined in point 3 of the thesis: the point, in each country, where joining beats staying out for a typical business not yet inside. Our working estimate is roughly 50% of core commercial trade volume, a guess that real data from the first unions will replace. The nearest published anchor is the paper's indirect argument that clearing would save more than 10% of a country's GDP if at least 40% of its companies took part (Fleischman, Dini and Littera, 2020). The authors say full validation awaits empirical study. That is a share of companies, not of trade volume, so it supports the order of magnitude only.

We do not reach 50% core commercial trade volume by attempting to build millions of new companies from scratch or fighting a direct political war against corrupt elites. Instead, migration happens through **irresistible economic physics**:

- **The Scale-Free Network Hypothesis:** Firm-level supplier networks have a few hubs with very many links (Fujiwara and Aoyama, 2010). Our hypothesis, to be tested in the first unions, is that securing the top 1% of high-density industrial hubs would pull their multi-tiered network of suppliers onto the ledger to free up money for them.
- **The Cost Advantage (to be measured):** Businesses operating inside the union clear working capital at 0% interest, paying only a small service fee, while legacy competitors pay for financing through bank interest, credit card fees, and long payment waits. How large the advantage is depends on what each business pays today, which we will measure in interviews and audits. As a working assumption only, we use financing costs of 12% to 18% a year and waits of 90 days or more. Neither is a measured average. In competitive markets, an advantage of that size, if it holds after fees, would be a strong operational edge. Legacy enterprises migrate to the moral-good network not out of sudden idealism, but because staying in the extractive financing system would cost them more.

- **Why members stay (hypothesis, to be tested):** My hypothesis for why the vision can turn into reality faster than expected is simple: people are not inherently a “good” or “bad” person. Whatever their nature, how most people act depends largely on what the systems around them reward. As we build open infrastructure strictly on moral good that makes moral evil reliably unprofitable, low-status, and rare, I expect human behavior inside it to shift quickly. People will not stay because they are told to be better. They will stay because it meets what humans need to live well in the short and long term: safety, freedom, fair treatment, growth, belonging, and the chance to contribute. Members will likely join for the working capital savings. If they then find that practicing moral good gets them more of what they genuinely want out of life, especially better relationships, adoption could compound faster than conventional wisdom predicts. The first unions will test this, and we report the result either way.

Execution and Domain Partnerships

To move through these phases, I need to partner with extraordinarily capable leaders across specialized domains. The network itself is not a traditional commercial vendor selling consumer products; it is an open trade infrastructure that delivers automated clearing, a debt map, fair dispute settlement, a portable record, and legal and tax compliance support. The domains are law and regulation, engineering and security, fair dispute settlement, country launches, partnerships, and finance and risk. Each leader runs their own domain.

Leaders operating within this ecosystem function inside the exact same consensus process everyone else follows. Their speed comes from being excellent at proposing, building, and executing infrastructure and member capabilities, never from any authority to bypass local union votes.

I do not want to be the leader everyone follows. I expect many domain leaders to gather around the work, each leading through their own work.

While development may use grants until member fees cover the network’s running costs, the network will never depend on outside capital or central funding to survive.

The network is owned by everyone in it, so no one is given shares to sell. The people who build it are paid fairly, by a fixed fee per outcome in the early stages, and later earn a share of network profit. The share is written down before the work starts, earned over years, and paid from the network’s surplus. Members set the split for later contributors by vote, so no single person can change it.

We will solve every hard problem sequentially with those who join, never expanding beyond what is empirically proven, treating every unvalidated incentive or legal interface as a foundational gap to be closed, and ensuring the Phase 0 provisional framework remains a flexible proposal that local union votes can continually refine.

PART III: WHY WORK ON THIS?

I'll first talk about my personal reason, then I'll touch on the defensive reason and the inspiration reason.

1. Personal Reason

I have many painful experiences that cause the excruciating pain of misery I'm constantly in. Here are some:

- **Family Betrayal:** When I was six years old, my father left us from the Philippines, went to the US, and didn't come back. Later on, we found out he's with another woman already. Our family is not well-off, so I assume one reason he betrayed us is because of money.
- **School as an Extractive Business:** Growing up, I followed my mom's advice to do well in school and graduate with honors so that "I'll be able to get a high-paying job". I did graduate with honors but the entry-level jobs I found in the Philippines were low-paying. All my skills were optimized on "graduating with honors", not on "getting a high-paying job". Later on, I understood that schools are businesses themselves. Some operate to maximize profits and put money ahead of the students and teachers they serve.
- **Corrupt Work Practices:** In my job as a structural engineer, my boss talked to me in private asking me to just let the failed structure seem like it passes so that we can submit the long-overdue project and get paid. He said he would be the one to take the blame if ever something bad happens to the structure once built. I realized he only cared about the money, not the people who would die if the structure actually fails. I just resigned from the company instead of finishing the task.
- **Exploitative Work:** I've had four different digital freelancing jobs. Despite being in different industries and different places around the world, all of them only cared about the money, not their employees and not the people they're serving.
- **Work Fraud:** My mom decided to get our first house built by a contractor she personally knew. I trusted my mom with her judgement and didn't bother prying into the specifics of her deal with the contractor because I was busy working 4 jobs. Later on, we found out that the contractor was a fraud and he disappeared one day when he got full payment, without even finishing the home.

One recurring theme in these five experiences was that many people only care about money, not others. Many people only care about themselves and their loved ones, not others. My hypothesis is that this is how money influenced and set the norms of society. Money, fame, status, and power aren't evil in themselves. They are tools, and the problem is that people who use them for moral evil get away with it, or that people care about these tools for personal gain more than they care about how their actions affect others. It's scary to think that as society progresses, more and more people would care only about money tied with fame, status, power or other social markers. I don't want this to happen.

This might sound extremely selfish, but it's best for me to be honest. One big reason I want to work on this vision is to save myself from this aching feeling of misery.

- I hate that everywhere I worked, my colleagues and/or boss only cared about money and it's okay for others to fall just so that they could rise.
- I hate that everywhere I go, there are people who are rude to low-paid kind hardworking workers but respectful to high-paid arrogant hardworking workers.
- I hate that the government system, the work system, the school system, and all other global systems favor the ones who make the most money regardless if they're doing moral evil.

- I hate that when I tried to ignore all of these and just lived my life, I felt empty. I tried working different jobs, but none of them made me happy. I went on vacations with my friends or with my mom, but I didn't feel happy. Every single day, it's like I'm alive, but I don't feel like I'm living.
- I hate this aching feeling of misery knowing that I can't change the way things are with the world because so much of the current system, and the people who benefit most from it, work to keep things as they are.

I want to change the world fast, and maybe as I'm doing the work, this feeling of misery would slowly go down, one union at a time, as more places uphold the framework of building high-quality products and services strictly on moral good. This is my personal reason.

2. Defensive Reason

As for the defensive reason, I believe that having everyone choose to uphold the new framework would meaningfully lower the chances of humanity getting wiped out. The points below are my reasoning, not proof.

- **AI Alignment and Learning Data:** If the norm everywhere in the world is to only do moral good, that removes one contributing factor in whether AI trained on human data ends up misaligned with us. It is not a guaranteed fix: a sufficiently capable, goal-pursuing system can discover deception or self-preservation as useful strategies on its own. But a world that treats moral evil as never an option is still one less thing feeding whatever an AI learns from us.
- **Reducing Human Grievance and Existential Threats:** The painful experiences that many humans harbor because of other people's moral evil are a real source of motivation for some to want revenge. If the norm everywhere is to only do moral good, removing a major, active source of grievance should lower how many humans end up wanting to see the human race wiped out.
- **Multi-Planetary Risk:** Even if humans become a multi-planetary species, that wouldn't remove the risk that comes from moral evil. As long as moral evil is still accepted in the physical world, the chances of civilization getting wiped out remain elevated.
- **AI Capability and Speed:** I fear the people building AI at the frontier are making AI much smarter and more capable than humans at any task, faster than society can test and manage the risks. AI can do moral good or moral evil, and the more capable AI gets, the more it matters which one it does. If the AI they're building now ends up advancing society through products and services built on both moral good and moral evil, I expect it will be much harder to build and uphold a world order built strictly on moral good. That is why I want to move fast, but I won't cut corners on the foundation.
- **Abundance Does Not Make a World Prioritize Moral Good:** Suppose AI and robots one day make everything people need, and money stops mattering. That removes the money-driven reasons for moral evil, such as fear of not having enough and the wish to get rich. But it does not remove the other moral evils. People can still deceive, coerce, and hurt each other for power, status, control, or revenge, and none of these require money. Abundance also removes the limits that once forced people to be careful. When making things cost almost nothing, nothing stops a person or an AI from using up or irreparably damaging the worlds they live on. The victims are everyone who depends on those worlds, including people not yet born, and none of them consented. Doing this knowingly is exploitation. None of this depends on who holds the power: humans, AI, or both. The question stays the same: will they choose moral good or moral evil? Abundance answers "how do we make enough?" Only a lived framework answers "what will we do with enough, and with each other?" Everyone should get the chance, starting young, to see

> for themselves that moral evil seriously damages people and civilization, so that moral good becomes their own framework for every act. In a world of abundance, the design stays the same: moral evil should cost standing, trust, relationships, and access to cooperation and opportunities. Money does not measure these, and removing them needs no force: everyone who knows what happened freely chooses to stop cooperating.

To be clear, moral evil causes suffering because someone else chose to do it. Natural evil is suffering that comes from the world itself, not from bad choices (like natural death, natural disasters, physical limits, grief, unrequited love, or honest failure). They say the path to wisdom is attained through struggle, pain, and failure. If moral evil becomes reliably unprofitable, low-status, and rare, humans, AI, and robots can still gain immense wisdom from the struggle and learning provided by natural evil.

To sum everything up, my hypothesis is that upholding a framework of moral good improves the probable lifespan of civilization.

3. Inspiration Reason

Life cannot just be about solving one sad problem after another. There must also be things that make you excited to wake up in the morning, look forward to the future, and feel that life is worth living.

A world where moral good is the norm and moral evil is rare enables humanity to often experience this great feeling, no matter what they pursue. Right now, I believe many people don't experience this, and I think the compounding ripple effects of moral evil are a major reason. The inspiration reason is to free everyone from the ripple effects of moral evil, so that everyone can wake up excited and do things that make them feel that life is worth living.

I know the journey will be very hard, and there are many risks I need to take. The message I need to remind myself of most is: *"Never give up doing work that leads to the vision."* I'll live as long as humanly possible to make the vision a reality and uphold it until everyone in the world embraces it as the better norm.

PART IV: OTHER PERSONAL DETAILS

Note that the information written here is just a tiny speck of who I am. You cannot assume that what's written here, or anything found on the internet, represents the full me. The only one who can fully understand me is me. Unless I have personally stated something in person or online, do not blindly believe what you see or hear from others about me. Get to know me personally on a genuine, deep level first, and then draw your conclusion.

Realizations and Philosophical Foundations

The painful experiences in my life, like the ones I outlined earlier, forced me to think deeply about how the world actually works. I don't claim to know everything, but I realized there is much about how the world works that most people are never taught. Incumbents benefiting from the status quo have little reason to share it.

My first breakthrough came from studying Alex Hormozi. His content opened my eyes: I had previously believed every domain was single-dimensional, but in fact everything is multi-dimensional. Business wasn't just about making money; it had philosophical, psychological, behavioral and many other

dimensions. Breaking free from limits that flatten how you think and create became part of how I work. I don't follow anyone blindly. I use a strict framework: **take what's useful, discard the rest, and add what is uniquely my own.**

Personal Philosophical Guardrails and Self-Compassion

In navigating any work, I keep a few personal principles as my daily guide:

1. **Observe Reality Unfiltered:** See the world through your own eyes first before adjusting to consensus opinion. Some legacy institutions function like scripted professional wrestling; recognizing this allows you to stay grounded in objective reality, even when called delusional. Then test the view: hold it only while evidence or a sincere critic could still change it.
2. **Be of Good Cheer:** Stay genuinely excited and maintain joy in the work, regardless of the scale of opposition or the complexity of the problems.
3. **Grace for Human Imperfection and Honest Failure:** Perfectionism is an unviable framework in a complex world. We must not confuse honest human limits (fatigue, failure, or technical mistakes) with active moral evil. You are entitled to be human, to fail, and to make mistakes without fear.
4. **Practice Self-Compassion First:** In a digital era where mistakes are permanently recorded, extend deep compassion to yourself first. Only when you allow yourself room to be an imperfect human being can you extend that same grace, patience, and compassion to others within the network.

Priority, Boundaries, and Bonuses

I choose to do what's good for me first and foremost. What's good for me is the work that leads to the vision, so that is my primary priority. Everything else is either a strict boundary or an added bonus.

- **Non-Negotiable Boundaries:** My family, eating great food, and exercising. Wherever the work takes me, my family comes too. I will never leave the people I care about behind for the sake of the vision. Likewise, I will not sacrifice my well-being.
- **Added Bonuses (Not Priorities):** Digital gaming, watching anime/dramas/vlogs/learning resources, reading manga/manhwa/manhua, and traveling the world with the people I care about while experiencing high-quality products and services.

To build this network, what I need most are people who believe in the vision, can manage themselves, possess the skills to execute work fast and excellently, and whom I genuinely enjoy working with. I will not work with people I don't like, regardless of how capable they are. That doesn't change who the vision is for; it only dictates who I choose to build it with day to day.

My Motivations

Apart from the personal, defensive, and inspiration reasons I mentioned before, here are my other motivations in no particular order:

1. **My mom.** I want to make my mom happy before she dies. She said that the biggest thing that'll make her happy is to see me succeed and do things that make me happy. I've tried many things but none of them have made me constantly feel happy. I think the answer is a combination of

work and relationships: work worth working, and genuine relationships built on moral good that make life worth living. I also want to give her something real, not because I owe it to her (she never asked for anything back), but because of how much she's given me without ever expecting it returned. One short-term goal is to give her $500k to spend for herself. This money isn't for me. It's a personal goal, separate from grant money, which is spent only on the work in the grant proposal. Another goal is to let her be free to find and do things that make her constantly truly happy.

2. **Deprivation.** I've come to understand that motivation grows out of deprivation, at least in part. We're more motivated to eat if we're deprived of eating. We're more motivated to sleep if we're deprived of sleeping. All my life, I've been mostly deprived of seeing people do moral good genuinely. In so many of my experiences, across every place I've gone and any nationality I've interacted with, it has felt like moral evil happens more often than moral good, regardless of the wealth, status, fame, or other social markers of the people involved. My hypothesis is that one big reason why people do moral evil, knowingly or unknowingly, is the pain and suffering they got from others who did moral evil, together with systems that reward it. Quantitatively, I believe moral good happens more often than moral evil. However, moral evil possesses a disproportionate structural weight wherein a single act can echo across generations, making it feel as though evil dominates the world.
3. **Emptiness.** All my life, I've experienced so much of the damage from moral evil ripples that I feel so empty. It feels like I've lived for fifty thousand years, life after life, each time searching for a place to belong. When I finally come across a place that feels like home, I still know deep down that it isn't where I truly belong, so I set off again. I believe leaving nothing to regret is the only way out of this cycle. That means living this life so fully that I'm no longer searching for somewhere else to belong. Working on this big vision is the only thing now that would not make me regret this life.
4. **Fighting for the life I want.** Before, I really didn't like all the power struggles at any level in society. But now I see it differently. That was just me running away. I realized I have to fight for the life I want, by building something better and letting people choose it, never by using moral evil. So this time, I'm giving it my all, within the boundaries I've set for my family and my well-being. I'm fighting for myself first, and for the people I care about, and for everyone this vision is for. So that when we make the vision a reality, moral evil becomes rare enough, and easy enough to handle, that it no longer runs my life, even on the days it still crosses my path.

A Direct Call to Action

If you feel the same with anything I said in this document, and possess the skills to execute the problems outlined in this plan, such as payments and financial regulation, supply-chain finance, running or governing community finance, designing fair dispute settlement, managing fraud and risk, building transparent ledger software, or fitting our debt-clearing framework to national regulatory sandboxes, reach out to me directly.

Tell me your experiences and which problem you want to solve first: ray@provensuccess.org
